

ChangeGuard Brief -- CG-106

Enforce Route Consistency Between Bookings and Voyages

Status: [!] Coordination required

Heads up

You're tasked with implementing critical server-side validation and frontend synchronization to ensure booking routes always align with their assigned voyages. This ticket has significant overlaps with several other active tickets, requiring careful coordination, especially in `server/src/routes/bookings.ts`.

Where you'll probably be working

This change will primarily involve updates across both the server and client: *

- server/src/routes/bookings.ts** (Confidence: 0.98) -- This is where you'll add the new validation logic to the `POST /api/bookings` and `PUT /api/bookings/:id` handlers to verify that the booking route matches the assigned voyage's route. *
- client/src/pages/BookingFormPage.tsx** (Confidence: 0.95) -- The frontend booking form will need updates to synchronize route and voyage selections, preventing incompatible combinations from being submitted. *
- server/src/db/seed.ts** (Confidence: 0.90) -- You'll need to update the seed data for booking BK-20250016 to align its route with voyage CAR-2503 as per requirements.

Tip: Treat these as starting points, not a fixed implementation plan. Verify the current code before making changes.

Watch for collisions (Concurrent Work)

You have several significant overlaps with other tickets, primarily affecting shared API route handlers and the booking form:

CG-101: Add Container Hold Status (Confidence: 0.95) Both tickets modify `server/src/routes/bookings.ts`. CG-101 adds new business logic related to container hold status, while this ticket adds route validation. Coordinate to ensure your new validation integrates cleanly without disrupting CG-101's changes or vice-versa, especially around the POST/PUT handlers.

CG-102: Block Billing Actions for Containers on Hold (Confidence: 0.95) This ticket also modifies `server/src/routes/bookings.ts` (specifically the PUT endpoint for validation) and `client/src/pages/BookingFormPage.tsx`. CG-102 introduces billing action blocking for held containers. Synchronize frontend changes to `BookingFormPage.tsx` and backend validation logic to avoid conflicting UI states or unexpected validation cascades.

CG-103: Emit Audit Events on Hold Status Transitions (Confidence: 0.95) Like CG-101, this ticket modifies `server/src/routes/bookings.ts` by adding functional logic. While potentially less direct conflict than validation logic, ensure that new route validation doesn't inadvertently interfere with event emission logic being added by CG-103.

CG-105: Refactor Booking Cutoff Logic into a Shared Policy Module (Confidence: 0.95) This is a critical overlap. CG-105 is *refactoring* existing logic out of `server/src/routes/bookings.ts`, potentially affecting the same POST/PUT handlers where you'll be adding new validation. It is highly recommended to check the status of CG-105 first. If it's in progress or landed, you should base your work on its refactored structure to avoid merge conflicts and ensure your validation targets the correct, consolidated logic.

CG-104: Add CSV Export for Bookings List (Confidence: 0.75) While CG-104 primarily uses `server/src/routes/bookings.ts` as a reference for filter logic, your work involves heavy modifications to the POST/PUT handlers. Less direct conflict, but be aware of any shared helper functions or data access patterns that might be affected by CG-104's use.

What this means for you (Action Plan)

Your primary concern is coordinating with other active work, particularly around `server/src/routes/bookings.ts` and `client/src/pages/BookingFormPage.tsx`. Start by checking the status of CG-105 and CG-102. If CG-105 is still open, consider coordinating with that developer to sequence your changes or work on a shared branch to integrate the refactor with your new validation. For the frontend, align with CG-102 to ensure a consistent user experience.

Quick summary

Aspect			Status / Guidance	Actionable Note
Execution Readiness			Coordination needed	Significant overlaps with multiple active tickets, primarily in <code>server/src/routes/bookings.ts</code> and <code>client/src/pages/BookingFormPage.tsx</code> .
Prerequisites (Must First)	Land	None	(No blocking upstream dependencies)	Begin coordination immediately.
Concurrent Overlaps	Work	&	CG-101, CG-102, CG-103, CG-105, CG-104	Shared files: <code>server/src/routes/bookings.ts</code> , <code>client/src/pages/BookingFormPage.tsx</code> .
Primary Merge Conflict Risk			High risk with CG-105 (Refactor Booking Logic)	Verify the status of CG-105 and base your work on its refactored structure if available, or coordinate on shared changes in <code>server/src/routes/bookings.ts</code> .
Independent / Isolated Work			None	All core tasks are impacted by concurrent work, requiring careful integration. Before coding, verify the status of CG-105, especially regarding
Recommended First Step			Coordinate with CG-105 and CG-102	<code>server/src/routes/bookings.ts</code> , and discuss <code>client/src/pages/BookingFormPage.tsx</code> changes with the CG-102 developer.
